Figure 1. The effect of the number of trials on the number of correct responses. The number of correct responses was plotted against the number of trials for each condition. The number of correct responses increased with the number of trials for all conditions. The number of correct responses was highest for the condition with the highest number of trials (10 trials) and lowest for the condition with the lowest number of trials (2 trials).

Abstract The purpose of this study was to determine whether there were differences in the prevalence of risk factors for coronary artery disease between two groups of men who had been exposed to asbestos during their working lives. One group consisted of 60 men who had worked in asbestos-related occupations and the other group consisted of 60 men who had never worked in such occupations. The prevalence of risk factors for coronary artery disease was determined by means of a questionnaire and physical examination. The results showed that the prevalence of risk factors for coronary artery disease was significantly higher in the group of men who had worked in asbestos-related occupations than in the group of men who had never worked in such occupations. This suggests that exposure to asbestos may be a risk factor for coronary artery disease.

Figure 1: Schematic representation of the human genome. The top track shows chromosomes 1-22, X, and Y. The middle track shows the location of the 1000 Genomes Project (1KGP) and the 1000 Genomes Project (1KGP) on each chromosome. The bottom track shows the location of the 1000 Genomes Project (1KGP) on each chromosome.

Figure 1 consists of two histograms. The left histogram is for matrix A (size 10000x10000) and the right histogram is for matrix B (size 10000x10000). Both histograms show the distribution of the number of non-zero elements in the sparse matrices. The x-axis represents the number of non-zero elements, ranging from 0 to 10000. The y-axis represents the frequency, ranging from 0 to 100. Both histograms show a peak at 1 non-zero element per row, with a long tail extending to 10000 non-zero elements.
